

Sales Dashboard

Power BI Business Intelligence & Data Analytics Report

Project Focus: Sales performance, product/category analysis, marketing channels, customer purchase funnel, payment methods, city filters, and monthly trends.

Prepared for: Data Analyst / Business Intelligence Portfolio

1. Executive Summary

The dashboard provides a high-level view of an e-commerce sales operation. The most important business signal is the strong concentration of sales in electronics and in a small number of products. The purchase funnel also shows a meaningful loss between product viewing and adding an item to the cart. Monthly performance is volatile, with a pronounced August peak followed by a sharp September decline.

KPI	Dashboard Value	Interpretation
Total Sales	6M PKR	Overall sales KPI shown on the dashboard
Total Customers	1.447K	Customer base displayed in the KPI card
Total Products	8	Products represented in product analysis
Total Purchased	112	Completed purchases shown in the funnel

2. Product & Category Insights

Top category: Electronics with approximately 5.383M PKR. The dashboard shows a strong concentration of sales in this category.

Top product: Laptop with approximately 2.470M PKR. Smartphone is the second-largest visible product at approximately 1.495M PKR.

This concentration creates an opportunity and a risk: high-performing products can drive revenue, but stock-outs, pricing problems, or demand changes in these products can materially affect overall performance.

Category	Sales	Share of visible category total
Electronics	5.383M PKR	85.1%
Furniture	0.672M PKR	10.6%
Accessories	0.267M PKR	4.2%

3. Marketing Channel Insights

Facebook is the leading visible marketing channel at 22.86%, followed by Mobile App at 21.80% and Google Ads at 19.16%. Together, these three channels represent approximately 63.82% of the displayed channel contribution. Marketing decisions should therefore compare the sales generated by these channels with their acquisition costs before increasing budget.

Channel	Contribution
Facebook	22.86%
Mobile App	21.80%
Google Ads	19.16%
Instagram	16.20%
Referral	11.49%
Website	8.46%

4. Customer Purchase Funnel

The funnel contains 500 visits and 112 purchases, producing an overall **22.4% visit-to-purchase conversion rate**. The largest absolute drop is from Product Viewed to Add to Cart: 140 users.

Stage	Users	Retention from previous stage
Visit	500	—
Product Viewed	405	81.0%
Add to Cart	265	65.4%
Checkout	165	62.3%
Purchased	112	67.9%

Stage conversion rates: Product View → Cart = 65.4%, Cart → Checkout = 62.3%, and Checkout → Purchase = 67.9%.

5. Payment Method Insights

Bank Transfer is the largest visible payment method (30.02%), followed by Cash on Delivery (23.85%). JazzCash, Card and Easypaisa also have meaningful contributions. The business should monitor payment failures and abandonment at checkout, especially where customers select a payment method but do not complete the purchase.

Payment Method	Contribution
Bank Transfer	30.02%
Cash on Delivery	23.85%
JazzCash	16.64%
Card	16.00%
Easypaisa	13.45%

6. Monthly Sales Trend

The monthly trend is volatile. The highest visible month is **August** at approximately 1.15M PKR, while the lowest is **September** at approximately 0.19M PKR. The sharp fall after August should be investigated rather than treated as normal variation.

Month	Approx. Sales
January	0.33M PKR
February	0.27M PKR
March	0.36M PKR
April	0.56M PKR
May	0.59M PKR
June	0.80M PKR
July	0.22M PKR
August	1.15M PKR
September	0.19M PKR
October	0.72M PKR
November	0.59M PKR
December	0.53M PKR

Note: Monthly values are approximate readings from the dashboard visual, not raw transaction-level data.

7. Business Recommendations

- **Improve the Product Viewed → Add to Cart stage:** This is the largest funnel loss. Test pricing, discounts, product images, reviews, delivery information, warranty messaging and stronger calls-to-action.
- **Protect high-value electronics inventory:** Electronics dominate category sales. Maintain adequate stock and monitor stock-outs for laptops, smartphones and monitors.
- **Optimize marketing ROI:** Prioritize Facebook, Mobile App and Google Ads for deeper ROI analysis, but compare revenue with campaign spend before increasing budgets.
- **Investigate August performance:** Identify the campaign, promotion, seasonality, product availability or external factor behind the August peak and evaluate whether it can be repeated.

- **Reduce payment friction:** Monitor checkout failures and incomplete payments. Keep popular payment methods easy to find and evaluate payment-method conversion separately.
- **Add profit analysis:** Revenue alone does not show business health. Add cost, profit and margin fields in a future dashboard version.

8. Data & Dashboard Quality Notes

The report is based on the values visible in the supplied dashboard screenshot. Some totals are rounded and a few visual-level values do not exactly reconcile with the headline 6M PKR KPI; this is expected when reading rounded labels from a dashboard rather than the underlying transaction table. City names are visible as slicer options, but city-level sales values are not displayed, so no ranking of cities is claimed in this report.

9. Portfolio Summary

This dashboard demonstrates practical Data Analyst skills: KPI design, categorical analysis, funnel analysis, time-series trend analysis, segmentation by channel and payment method, interactive slicers, and business-oriented recommendations. For a stronger portfolio version, the next step is to connect the dashboard to a clean source dataset and add profit, customer segmentation, ROI and year-over-year metrics.
